

On the Subject of Buttonpads

Pressing four buttons may seem straightforward. That's the kind of thinking that gets you indoctrinated.

See Appendix A for indicator reference.

See Appendix B for battery reference.

See Appendix C for port identification reference.

Follow these rules in the order they are listed. Hold the correct button based on the first condition that applies:

1. If there is a blue button with the  symbol on it, then hold that button.
2. If exactly three of the buttons are the same color, hold the button with the unique color.
3. If there is a white button and one of the buttons has a  symbol on it, hold the bottom-right button.
4. If there is a serial port and an indicator labeled BOB, hold any blue button. If none exist, hold the top-left button.
5. If a button has the  symbol or the  symbol on it, hold any button that doesn't have those symbols.
6. If none of the buttons have the  symbol and there are no yellow buttons, hold any button with a unique color. If none exist, hold the top-right button.
7. If exactly one button has the  symbol, the  symbol, or the  symbol, hold the button horizontally adjacent to it.
8. If exactly one or three buttons have the  symbol, the  symbol, the  symbol, or the  symbol, hold the button vertically adjacent to the outlier.
9. If none of the symbols in the above rules appeared, hold any button diametrically opposite to a button with a unique color. If none exist, hold the bottom-left button.
10. If none of the rules apply, hold the top-left button.

The above only applies to the first button. The correct button to hold after the first one is the same as the LED that most recently turned on.

Releasing a Held Button

If you starting holding a button down, a different button's LED will light up. Note down the color that lit up. Based on the color and label of the currently held button, you must release it at a specific time.

- Use the two columns with the button's color at the top.
- Find the symbol on the button within both columns; only one of the symbols will appear in each column.
- Take the number on the leftmost item in the two rows.
- Sum these two numbers together, take the digital root, and release the button when this digit is displayed.

Button Colors:								
1	©	⌘	ζ	⌵	Ξ	Α	☼	б
9	★	Ꞥ	Α	æ	Є	Q	¿	Ђ
3	☆	⌘	Q	λ	✖	Ë	ζ	∇
4	☪	¶	⌘	Ë	Ꞥ	б	⌵	Й
8	Ж	Ɔ	⌘	⌘	Ω	⌘	☪	Х
2	Ω	Ξ	✖	∇	Ψ	Є	б	λ

- Pair each button's LED with its label to get four colored symbols.
- For example, if a **Q** had a blue LED light up on its button, it would be a blue **Q**.
- Only one column above contains all four colored symbols.
- Press and immediately release each button in the order their labels appear from top to bottom within that column to disarm the module.
- The buttons can only be safely pressed and released when the bomb's timer contains the row digit of the symbol.
- If a submission was incorrect, the correct button to hold instead becomes the button that was held first.
